

# Core Java

---

## Collection framework

### Queue interface

- Represents utility data structures (like Stack, Queue, ...) data structure.
- Implementations: LinkedList, ArrayDeque, PriorityQueue.
- Can be accessed using iterator, but no random access.
- Methods
  - `boolean add(E e)` - throw `IllegalStateException` if full.
  - `E remove()` - throw `NoSuchElementException` if empty
  - `E element()` - throw `NoSuchElementException` if empty
  - `boolean offer(E e)` - return false if full.
  - `E poll()` - returns null if empty
  - `E peek()` - returns null if empty
- In queue, addition and deletion is done from the different ends (rear and front).

### Deque interface

- Represents double ended queue data structure i.e. add/delete can be done from both the ends.
- Two sets of methods
  - Throwing exception on failure: `addFirst()`, `addLast()`, `removeFirst()`, `removeLast()`, `getFirst()`, `getLast()`.
  - Returning special value on failure: `offerFirst()`, `offerLast()`, `pollFirst()`, `pollLast()`, `peekFirst()`, `peekLast()`.
- Can used as Queue as well as Stack.
- Methods
  - `boolean offerFirst(E e)`
  - `E pollFirst()`
  - `E peekFirst()`
  - `boolean offerLast(E e)`
  - `E pollLast()`
  - `E peekLast()`

### ArrayDeque class

- Internally ArrayDeque is dynamically growable array.
- Elements are allocated contiguously in memory.

### LinkedList class

- Internally LinkedList is doubly linked list.

### PriorityQueue class

- Internally PriorityQueue is a "binary heap" data structure.
- Elements with highest priority is deleted first (NOT FIFO).
- Elements should have natural ordering or need to provide comparator.

### **Set interface**

- Collection of unique elements (NO duplicates allowed).
- Implementations: HashSet, LinkedHashSet, TreeSet.
- Elements can be accessed using an Iterator.
- Abstract methods (same as Collection interface)
  - add() returns false if element is duplicate

### **HashSet class**

- Non-ordered set (elements stored in any order)
- Elements must implement equals() and hashCode()
- Fast execution

### **LinkedHashSet class**

- Ordered set (preserves order of insertion)
- Elements must implement equals() and hashCode()
- Slower than HashSet

### **SortedSet interface**

- Use natural ordering or Comparator to keep elements in sorted order
- Methods
  - E first()
  - E last()
  - SortedSet headSet(E toElement)
  - SortedSet subSet(E fromElement, E toElement)
  - SortedSet tailSet(E fromElement)

### **NavigableSet interface**

- Sorted set with additional methods for navigation
- Methods
  - E higher(E e)
  - E lower(E e)
  - E pollFirst()
  - E pollLast()
  - NavigableSet descendingSet()
  - Iterator descendingIterator()

### **TreeSet class**

- Sorted navigable set (stores elements in sorted order)

- Elements must implement Comparable or provide Comparator
- Slower than HashSet and LinkedHashSet
- It is recommended to have consistent implementation for Comparable (Natural ordering) and equals() method i.e. equality and comparison should be done on same fields.
- If need to sort on other fields, use Comparator.

```
class Book implements Comparable<Book> {
    private String isbn;
    private String name;
    // ...
    public int hashCode() {
        return isbn.hashCode();
    }
    public boolean equals(Object obj) {
        if(!(obj instanceof Book))
            return false;
        Book other=(Book)obj;
        if(this.isbn.equals(other.isbn))
            return true;
        return false;
    }
    public int compareTo(Book other) {
        return this.isbn.compareTo(other.isbn);
    }
}
```

```
// Store in sorted order by name
set = new TreeSet<Book>((b1,b2) -> b1.getName().compareTo(b2.getName()));
```

```
// Store in sorted order by isbn (Natural ordering)
set = new TreeSet<Book>();
```

## HashTable Data structure

- Hashtable stores data in key-value pairs so that for the given key, value can be searched in fastest possible time.
- Internally hash-table is a table(array), in which each slot(index) has a bucket(collection). Key-value entries are stored in the buckets depending on hash code of the "key".
- Load factor = Number of entries / Number of buckets.
- Examples
  - Key=pincode, Value=city/area
  - Key=Employee, Value=Manager
  - Key=Department, Value=list of Employees

## hashCode() method

- Object class has hashCode() method, that returns a unique number for each object (by converting its address into a number).
- To use any hash-based data structure hashCode() and equals() method must be implemented.
- If two distinct objects yield same hashCode(), it is referred as collision. More collisions reduce performance.
- Most common technique is to multiply field values with prime numbers to get uniform distribution and lesser collisions.
- hashCode() overriding rules
  - hash code should be calculated on the fields that decides equality of the object.
  - hashCode() should return same hash code each time unless object state is modified.
  - If two objects are equal (by equals()), then their hash code must be same.
  - If two objects are not equal (by equals()), then their hash code may be same (but reduce performance).

## Map interface

- Collection of key-value entries (Duplicate "keys" not allowed).
- Implementations: HashMap, LinkedHashMap, TreeMap, Hashtable, ...
- The data can be accessed as set of keys, collection of values, and/or set of key-value entries.
- Map.Entry<K,V> is nested interface of Map<K,V>.
  - K getKey()
  - V getValue()
  - V setValue(V value)
- Abstract methods

```
* boolean isEmpty()
* int size()
* V put(K key, V value)
* V get(Object key)
* Set<K> keySet()
* Collection<V> values()
* Set<Map.Entry<K,V>> entrySet()
* boolean containsValue(Object value)
* boolean containsKey(Object key)
* V remove(Object key)
* void clear()
* void putAll(Map<? extends K,? extends V> map)
```

- Maps not considered as true collection, because it is not inherited from Collection interface.

## HashMap class

- Non-ordered map (entries stored in any order -- as per hash code of key)
- Keys must implement equals() and hashCode()
- Fast execution
- Mostly used Map implementation

**LinkedHashMap class**

- Ordered map (preserves order of insertion)
- Keys must implement equals() and hashCode()
- Slower than HashSet
- Since Java 1.4

**TreeMap class**

- Sorted navigable map (stores entries in sorted order of key)
- Keys must implement Comparable or provide Comparator
- Slower than HashMap and LinkedHashMap
- Internally based on Red-Black tree.
- Doesn't allow null key (allows null value though).

**Hashtable class**

- Similar to HashMap class.
- Legacy collection class (since Java 1.0), modified for collection framework (Map interface).
- Synchronized collection -- Thread safe but slower performance
- Inherited from java.util.Dictionary abstract class (it is Obsolete).
